

LuMac Canopies Gutter Height explained

LuMac Lean-To Canopies are delivered as standard with 2500mm leg posts.
LuMac Freestanding Canopies are delivered as standard with 2850mm leg posts.

Longer legs can be supplied to achieve a higher gutter height. The finished gutter height is relative to the leg length - longer legs means a higher gutter!

The following hole dimensions apply for lean-to canopies, free-standing canopies require a larger hole at 750 x 750 x 750mm, however the same principles apply.

1. If you do not already have a solid concrete base at the location of the leg/feet then you will need to mount your leg/feet into a footing. By doing this you will end up with a finished underside of gutter of 2100mm.

2. If you do already have a solid concrete base at the location of the leg/feet then to can fix directly to that, using suitable anchor bolts.

Please note that canopies are subject to wind loading and not just weight from above. As such the solid concrete base must be heavy enough to keep the canopy grounded. Our minimum recommendation is the dimensions shown above for lean-to canopies and 750 x 750 x 750mm for free-standing canopies.
